Set map300

Set SW. Solar wind and geomagnetic conditions for the quiet days. Panels from top to bottom: solar wind bulk velocity V ; solar wind dynamic pressure P_d ; interplanetary magnetic field magnitude B (blue dotted curve) and B_z component (black solid curve); auroral electrojet index AE ; storm-time Dst index. The day on June, indicated by vertical red dashed lines, is very quiet in the solar wind and geomagnetic parameters.

Upstream solar wind data are acquired from Wind upstream monitor (<https://cdaweb.sci.gsfc.nasa.gov/index.html/>)
Geomagnetic parameters AE and Dst are provided by Kyoto WDC (<http://wdc.kugi.kyoto-u.ac.jp/wdc/Sec3.html>)

Set map030. Geographic maps of averaged electron fluxes with energies >30 keV and pitch angles of $\sim 90^\circ$ observed during quiet days by POES satellites at height of ~ 850 km in 2 hour vicinity of local noon. The solid wide curve indicates the geomagnetic equator. The outer and inner electron belts and a slot region between them are clearly seen, respectively, at high and middle latitudes in the longitudinal range from $\sim 90^\circ$ E to $\sim 80^\circ$ W.

The POES data are provided by NOAA (<https://www.ngdc.noaa.gov/stp/satellite/poes/dataaccess.html>)

Set map100. Geographic maps of averaged electron fluxes with energies >100 keV and pitch angles of $\sim 90^\circ$ observed quiet days by POES satellites at height of ~ 850 km in 2 hour vicinity of local noon. The solid wide curve indicates the geomagnetic equator. The outer and inner electron belts and a slot region between them are clearly seen, respectively, at high and middle latitudes in the longitudinal range from $\sim 90^\circ$ E to $\sim 80^\circ$ W.

The POES data are provided by NOAA (<https://www.ngdc.noaa.gov/stp/satellite/poes/dataaccess.html>)

Set map300. Geographic maps of averaged electron fluxes with energies >300 keV and pitch angles of $\sim 90^\circ$ observed quiet days by POES satellites at height of ~ 850 km in 2 hour vicinity of local noon. The solid wide curve indicates the geomagnetic equator. The outer electron belt is clearly seen at high latitudes.

The POES data are provided by NOAA (<https://www.ngdc.noaa.gov/stp/satellite/poes/dataaccess.html>)
