

Comments on revised manuscript “**A case study of the large-scale traveling ionospheric disturbances in the East Asian sector during the 2015 St. Patrick’s Day geomagnetic storm**” by Liu et al 2019

The authors have addressed all the comments comprehensively and the manuscript is significantly improved. There are still some missing words and I would like to suggest that careful language proofreading and editing is done by the authors.

The manuscript is acceptable and from my reading, I don't think that it needs another round of review.

I have one minor comment that I leave for the authors to decide whether to consider or not.

Lines 15-17: The text which talks about trough and crest. I suggest that the authors modify the statement to “Results show a LSTID spanning at-least 60 degrees in longitude (60°E-140°E) occurs as a result of possibly AGWs propagating from high to lower latitudes around 09:40 UT-?? ... (here the end time should also cover the crest of the LSTID)”

Line 18, “...high frequency Doppler shift ...”, shouldn't the word “shift” be “radar”?
