6  
7           **Abstract:** In this paper, it is reviewed the relationships between the aurora  
8 observations, past solar activity and climatic change in Anatolia during medieval period.  
9 For this purpose, it is presented two historical aurora catalogs for Anatolia and Middle  
10 East regions at various dates in order to understand the past solar activity and possible  
11 physical mechanism using historical texts, chronicles and other auroral records. The  
12 available catalogs in literature are covered records observed in the Europe, Japan,  
13 China, Russia and Middle East. There is no study dealing only with the historical aurora  
14 observations recorded in Anatolia. The data of the catalog strongly support that there is  
15 a considerable relationship between the aurora activity and past strong solar activity. An  
16 unusually high auroral activity during the years around 1100 in Anatolia and Middle East  
17 is quite consistent with the past solar variability, geomagnetic field intensity and  
18 planetary climatic changes drastically impacting on the economy and human events.

19  
20           **Keywords:** Historical aurora records; Solar activity; Climatic changes; Anatolia.

## 23           1.     **Introduction**

24           A number of researchers presented the low and middle-latitude aurora catalogs  
25 (Table 1) from Europe (Mairan, 1733; Frobeseius 1739; Fritz, 1873; Schove, 1948; Link,  
26 1962; Dall’Olmo, 1979; Stothers, 1979; Krivsky and Pejml, 1988; Vaquero et al., 2010;  
27 Scafetta and Willson, 2013), Arabic countries (Basurah, 2006), Japan (Matsushita, 1956;  
28 Nakazawa et al., 2004; Shiokawa et al., 2005), and China (Schove and Ho, 1959;  
29 Keimatsu,1976; Hayakawa et al., 2015). Aurorae are the most majestic luminous  
30 phenomenon observed in the sky. The historical aurora catalogs have been used to  
31 recognize the past solar activities (Siscoe, 1980; Silverman, 1992; Schröder, 1992;  
32 Schröder 1994; Basurah, 2006; Vazquez et al., 2006; Hayakawa et al., 2015), Earth’s  
33 climate change (Pang and Yau, 2002; Schröder, 2004; Gallet et al., 2005; Bard and  
34 Frank, 2006; Scafetta, 2012) and perception of human civilizations (Schröder, 2004;  
35 Gallet et al., 2006; Silverman, 2006). The state of the geomagnetic field and the form of  
36 magnetosphere extremely control the location of auroral zone (Korte and Stulze, 2016).  
37 The visibility of the aurorae at low latitudes is very scarce and closely connected with the  
38 strong geomagnetic storms related to the high-speed solar wind or interplanetary  
39 transients (Eather, 1980; Basurah, 2006; Vazquez et al., 2006).

40           Mairan (1733) presented that the first scientific monography covers a list of 229  
41 historical aurorae during the period of 502-1731. In 1852, Wolf noticed that the aurorae  
42 match with periods of high sunspot number, according to the historical aurora catalog  
43 including more than 6300 records (Wolf, 1857). Fritz (1873), who listed 77 European  
44 Aurora records during 1707-1708, published the historical auroral catalog and separated  
45 auroral sightings into five categories based on the latitude and longitude (Schröder,  
46 1994). Link (1962) published a useful aurora catalog seen in European countries based

47 on eight previous catalogs compiled by Frobesius (1739), Mairan (1754), Schoning  
48 (1760), Boué (1856), Wolf (1857), Lovering (1868), Fritz (1873) and Seydl (1954).

49 Dall’Olmo (1979) listed 59 auroral observations displayed throughout medieval  
50 period reported from European sources. Stothers (1979) compiled an extensive ancient  
51 aurora catalog in Europe observed by the Mediterranean basin peoples and proved the  
52 ancient auroral cycle simulates the modern cycle.

53 Vaquero et al. (2010) declared a set of auroral observation of Francisco Salva  
54 Campillo who recorded in Barcelona during 1780-1825. This catalog represents a  
55 sudden drop in the number of annual auroral observations at about 1793 owing to the  
56 secular minimum in solar activity (Vaquero et al., 2010). Scafetta and Willson (2013)  
57 studied the historical Hungarian auroral records covering 438 years. They found that the  
58 maxima of the auroral observations conform to the maxima in the sunspot records and  
59 there is a positive correlation amidst the auroral records, the solar and climate activities.  
60 Korte and Stolze (2016) showed that the intensity and tilt of the geomagnetic field and  
61 high solar activity are closely related to the Aurora occurrence.

62 The available catalogs described above present a number of records covering  
63 Europe, Japan, China, Russia and Middle East. There is no study dealing only with the  
64 historical aurora observations recorded in Anatolia. Anatolia have not been studied until  
65 now with respect to meteorological and aurora observations. The goal of this study is to  
66 compile a historical Anatolian aurora catalog (hAAc) during medieval period by scanning  
67 the available sources and catalogs in literature. The catalog could be used to analyze  
68 the past solar activity and planetary climatic changes impacting on the economy and  
69 human events. This research may also contribute to the understanding of public  
70 perception of the historical auroras.

## 71           **2.     Historical Anatolian Aurora Catalog (hAAC) through medieval period**

72           It is propounded a historical aurora catalog observed only in Anatolia during  
73 medieval period collected from Link (1962), Botley (1964), Baldwin (1969), Newton  
74 (1972), Stothers (1979), Eather (1980), Melissinos, (1980), Silverman (1998), Dall’Olmo  
75 (1979), Andreatyan (2000), Little (2007), Silverman (2006), Neuhäuser and Neuhäuser  
76 (2015) resources. In this catalogue, 23 different historical aurora records observed in  
77 Anatolia are presented during medieval period in Table 2. The location map of the  
78 historical Anatolian observations is given in Figure 1. A number of Anatolian aurora  
79 observations are summarized in Table 3. Another collected ancient aurora catalog  
80 consisting 45 auroral observations is shown in Table 4 for the Middle East region during  
81 the same period using Islamic historical texts, Arabic chronicles and other auroral  
82 records given in Table 1. These two catalogues are plotted in Figure 2 and evaluated  
83 altogether. The historical Anatolian and Middle East aurora records overlap through  
84 medieval period especially between 1097 and 1129 years (Figure 3). Also, Chinese and  
85 European aurora observations are in harmony with each other in this period (Siscoe,  
86 1980).

87           According to the paper by Neuhäuser and Neuhäuser (2015), five criteria are  
88 implemented to perform the aurora catalogs as night-time (darkness, sunset, sunrise),  
89 non-southern directions (northern, NE, NW, E-W, W-E), color (red, reddish, fiery, bloody,  
90 green, black), dynamics (fire, fiery), and repetition. The strength of the aurora can be  
91 determined by considering its color, brightness, dynamics, duration, geomagnetic  
92 latitude. The observation is classified as potential (N=0), possible (N=1), very possible  
93 (N=2), probable (N=3), very probable (N=4), or certain (N=5) according to the criteria  
94 number (N) satisfied (Neuhäuser and Neuhäuser, 2015).

95 In Anatolia, the first auroral observation was done in Constantinople at 333  
96 (Stothers, 1979). Stothers (1979) described these observations as a sky fire (N=1)  
97 according to the works of Aurelius Victor (320-390), who was a historian and politician of  
98 the Roman Empire. On the other hand, Eather (1980) described an Aurora observation  
99 over Constantinople at about 360 BC during the siege on Byzantium by Philip of  
100 Macedonia.

101 Little (2007) described an aurora observation record in Constantinople at 396: “A  
102 fiery cloud was observed from the East while the city darkened. At first, it was small, but  
103 later gradually grew and moved towards the city. At last, it terribly enlarged and poised  
104 over the entire city. A terrifying flame appeared to hang down. All people stacked to the  
105 church, and the place could not receive huge mass” (N=3).

106 According to the Link (1962), an aurora appeared in Asia Minor on 22 August  
107 502, Thursday. This aurora was also observed both in Edessa (Botley, 1964) and  
108 Palestine after an earthquake (Russell, 1985) based on to the Chronicle of Joshua the  
109 Stylite. Joshua the Stylite described it: “On the 22rd of August this year, on the night  
110 preceding Friday, a great fire appeared to us blazing in the northern quarter the all night.  
111 It was believed that the whole earth was going to be devastated that night by a fire  
112 storm. However, the mercy of our Lord preserved us without damage” (N=3). This  
113 appearance of the aurora borealis was also reported in Chronicon Edessenum without  
114 apocalyptic detail (Trombley and Watt, 2000).

115 According to the *Historia Ecclesiastica* of Ptolomaeus Lucensis there was an  
116 aurora sighting at a night of 633 in Constantinople (Dall’Olmo, 1979): “A bloody sign  
117 appearing just at that time was sighted. A bloodstained spear and a sharp light were  
118 observed on the sky for nearly all night” (N=4). Theophanes (758/760-817), a Byzantine

119 monk, theologian, and chronicler, reported an observation in 667 winter: “There was a  
120 sign which appeared in the sky in the same winter” (N=1). Theophanes reported another  
121 observation in 675-676: “This year a sign was seen in the sky on a Sabbath day” (N=1;  
122 Turtledove, 1982).

123 Theophanes recorded three aurora events for 734, 743 June and 744 in  
124 Constantinople. The first aurora observation was reported in 734: “A fiery sign shining  
125 like a burning brand appeared in the sky in Constantinople” (N=2). The second aurora  
126 observation was recorded by Theophanes in June of 743: “In the northern sky of  
127 Constantinople, a sign was observed in the month of June” (N=1; Turtledove, 1982). The  
128 last aurora record was observed in Constantinople for 744: “In the northern sky, a sign  
129 seemed this year, and dust fell in several places” (N=1; Turtledove, 1982; Neuhäuser  
130 and Neuhäuser, 2015).

131 The low-latitude aurorae of 772-773 are interesting, as being very close to the  
132 extreme solar event of 774-775 (Miyake et al., 2012; Usoskin et al., 2013; Mekhldi et al.,  
133 2015). Harrak (1999) listed two aurorae records observed near Amida in the early 770s  
134 based on the Chronicle of Zuqnin. In the Chronicle of Zuqnin, the first observation was  
135 recorded in 772, Amida (Turkey): “Another sign was seen in the northern side, and its  
136 view gave evidence about the menace of God against us. It appeared at reaping time,  
137 while wrapping the whole northern side of the sky from west to east end. It was look like  
138 a green sceptre, a red one, a yellow one, and a black one. It was ascending from the  
139 ground and changing into 70 shapes, while one sceptre was emerging and another  
140 disappearing” (N=3). The second observation was recorded in the Chronicle of Zuqnin in  
141 773, Amida (Turkey): “In the month of June, on a Friday, another sign that was seen a  
142 year ago in the northern region was appeared again this year. It was on Fridays that it

143 used to appear during these three consecutive years, stretching itself out from the  
144 eastern side to the western side. The sign would change into many shapes in such a  
145 way that as soon as a green ray vanished, a red one would appear, and as soon as the  
146 yellow one vanished, a green would appear, and as soon as this one vanished, a black  
147 one would appear” (N=3; HARRAK, 1999; Neuhäuser and Neuhäuser, 2015). These two  
148 observations listed by HARRAK (1999) and Neuhäuser and Neuhäuser (2015) based on  
149 the Chronicle of Zuqnin were also cited by Dall’Olmo (1979) according to the Chronique  
150 de Denys de Tell-Mahré (Chabot, 1895) with different dating. Mekhaldi et al. (2015)  
151 indicated that these two extreme events (772/773) were five times greater than any  
152 other recorded solar storms with instruments. In Constantinople, another aurora  
153 observation was recorded in 988: “A luminous star and fiery pillars seen in the northern  
154 region of the sky for some nights. They frightened the people who saw them.” (N=3;  
155 Dall’Olmo, 1979).

156 Matthew of Edessa, who wrote a chronicle, described the events that occurred  
157 between the years 952 and 1136, and reported four aurora observations around the  
158 year 1100 (Andreasyan, 2000). Matthew of Edessa reported the first aurora observation  
159 in the Armenian year 546 (25.02.1097–24.02.1098): “In this year, an odd and horrible  
160 signs were observed in the the northern side of the sky. No one had ever seen such an  
161 amazing omen so far. In the month of November, the sky kindled and reddened though  
162 the air was clear and quiet. The bloody sky was covered with stacks as if clustered on  
163 top of one another becoming colorful. The stacks were set to slip through in an easterly  
164 direction, dispersed after having gathered, and enveloped the large amount of the sky.  
165 Then, the dark redness such an amazing degree reached up to the middle of the sky  
166 vault. The savants and sages interpreted this phenomenon that, it was a sign of

167 bloodshed. Actually, terrible events and disasters we included as a short story in our  
168 book were soon to be fulfilled.” (N=3).

169 Krey (1921) described an aurora observation during the siege of Antioch on the  
170 account of eyewitnesses and participants in the first crusade: “A great earthquake  
171 occurred on the third day before the Kalends of January (30 December 1097), and a  
172 very fabulous sign was noticed in the sky. Northern part of the sky was so red that it  
173 appeared as if sun rose to inform the day in the first sight of the night” (N=3). This  
174 observation was also described by Baldwin (1969): “There was an earthquake on  
175 December 30<sup>th</sup>, and a frightening display of the aurora borealis next evening, and in this  
176 way God chastised his army, so that we were intent upon the light which was rising in  
177 the darkness, yet the minds of some were so blind and abandoned that they were  
178 recalled neither from luxury nor robbery. At this time the Bishop prescribed a fast of  
179 three days and urged prayers and alms, together with a procession, upon the people;  
180 moreover, he commanded the priests to devote themselves to masses and prayers, the  
181 clerics to psalms”. On the other hand, another aurora was observed on 3 June 1098 at  
182 Antioch based on the Link (1962) catalog as a fiery red sky (N=2; Silverman, 2006).

183 The Matthew of Edessa recorded second aurora observation in the Armenian  
184 year 547 (25.02.1098–24.02.1099). “In the same year, a new sign appeared in the  
185 northern part of the sky. At the fourth hour of the night, the sky appeared more inflamed  
186 than before, and a dark red color. This phenomenon lasted from the evening until the  
187 fourth hour of the night. Such a terrible omen had never been seen so far. This omen  
188 raised upwards gradually and covered the northern portion of the sky with the lines  
189 reaching the hills. All stars took a fiery color. This phenomenon was an omen of rage  
190 and catastrophe” (N=4; Andreatyan, 2000). Botley (1964) reported an auroral

191 observation in Antioch as a blaze of light girdled Pole (N=1). Link (1962) dated this  
192 observation on September 27, 1098.

193 In the Armenian year 548 (25.02.1099–24.02.1100) Matthew reported another  
194 aurora observation: “A fiery sign of dark red color appeared in the sky in this year. This  
195 omen heading from the northern to the eastern part of the sky appeared until the  
196 seventh hour of the night and then became black. It was said that this phenomenon was  
197 a sign of bloodshed of Christians. These predictions were truly realized. No favorable  
198 omen did not appear since the day when the Franks began their expedition. All omens,  
199 however, marked to realize the destruction, death, slaughter, famine and other diverse  
200 disasters” (N=3; Andriasyan, 2000).

201 Matthew recorded the last aurora observation in the Armenian year 549  
202 (25.02.1100–24.02.1101): “The northern part of the sky flushed red for the fourth time in  
203 this year. The fiery red omen appeared more horrific than the previous one and  
204 subsequently changed into black. This fourth appearance coincided with a lunar eclipse.  
205 This phenomenon was a sign of the celestial wrath of God over the Christians as  
206 previously said by the prophet Jeremiah with these words: “His wrath will blaze up from  
207 the northern part of the sky. Indeed, several misfortunes occurred as we never could  
208 have expected” (N=3; Andriasyan, 2000).

209 Dall’Olmo (1979) reported an aurora observation based on the Chronicle of  
210 Michael the Syrian translated into French by Chabot (1968): “In the year 1108, a light  
211 like the sunlight was seen in the middle of the night, and remained about three hours in  
212 Djihan region near Adana” (N=2). Dall’Olmo (1979) was also cited 12 auroral records  
213 observed probably in the Middle East from 745 to 1141 (Table 4) according to the  
214 Chronicle of Michael the Syrian (Chabot, 1968).

215 On December 16, 1117, an aurora was recorded in Asia Minor (Link, 1962). In the  
216 same date, two observations were also reported in the Middle East (Newton, 1972) and  
217 in Palestine (Botley, 1964). These two observations could be same event. Link (1962)  
218 described other observations in Asia Minor in the year 1119. This event might be the  
219 same record observed in Armenia (Botley, 1964) given in Table 4.

220 Priest Grigor, who continued the Matthew's Chronicle and recorded events for the  
221 years 1136/37-1162/63, added one aurora observation in about the year 1143. In the  
222 Armenian year 592 (14.02.1143-13.02.1144) Priest Grigor described the aurora  
223 observation: "On Holy Thursday (1 April 1143), an omen forming of a luminous column  
224 appeared in the northern portion of the sky. This omen was visible for eight days. Three  
225 sovereigns died after the appearance of this phenomenon" (N=3; Andreasyan, 2000).

226

### 227 **3. Results and Discussions**

228 The main purpose of this study is to present an aurora catalog for the Anatolia  
229 during the medieval period. 23 different historical aurora records are presented during  
230 the medieval period in Anatolia (Table 2). Another aurora catalog containing 45 records  
231 collected from different sources is also given (Le Strange, 1890; Link, 1962; Botley,  
232 1964; Newton, 1972; Dall'Olmo, 1979; Silverman, 1998; Basurah, 2006) for the Middle  
233 East region (Table 4). The aurora observations were described as "sign", "a fiery shining  
234 sign", "a very fabulous sign", "red sky", "a fiery red sky", "sky fire", "a great fire", "a fiery  
235 cloud", "a frightful and strange omen", "a fire-like omen", "a bloody spear light", "blaze of  
236 light", "a sunlight light". The form of aurorae was defined as "luminous column". The  
237 aurorae were generally seen in the northern and eastern part of the sky. The color of the  
238 aurora observations were red, green, yellow and black depending on the height and

239 relative concentrations of the nitrogen and oxygen compounds in the atmosphere  
240 (Eather, 1980). The number N sort out only the probability that an event could be an  
241 aurora or not. The possibility of the aurora could be decided by regarding its duration  
242 geomagnetic latitude, color, brightness and dynamics. Aurorae observations with  $N \geq 3$   
243 tend to be true.

244 The aurora records strongly correlated to high solar activity (Siscoe, 1980)  
245 provide some information about the Sun-Earth interaction as previously proved by  
246 Scafetta (2012). They are the longest direct observational records available for studying  
247 solar and space weather dynamics. Stronger solar dynamics were realized in aurorae  
248 with color green-yellow-red as seen in 772 and 773 in Amida. Miyake et al. (2012) and  
249 Usoskin et al. (2013) confirmed the 770s high solar events presenting  $^{14}\text{C}$   
250 measurements from the annual rings of the cedar trees in Japan and inappropriate  
251 carbon cycle model in German oak, respectively. The auroral records have also proven  
252 itself to be a valuable data source for the investigation of the secular variation of solar  
253 activity. Paleomagnetic researchs demonstrate that the recent dipole strength was  
254 nearly 50% weaker than it was 2500 years ago (Raspopov et al., 2003). Siscoe and  
255 Siebert (2002) indicated that the dipole strength was 1.5 times as large as that of the  
256 present value. The long-term variation of the geomagnetic latitude and dipole moment  
257 might be the reason of observing aurorae in Anatolia. The average dipole moment for  
258 750 and 1250 are  $8.85 \cdot 10^{22} \text{ Am}^2$  and  $8.90 \cdot 10^{22} \text{ Am}^2$  slightly higher than the present  
259 value of  $7.78 \cdot 10^{22} \text{ Am}^2$  (Korte and Constable, 2005; Gallet et al., 2005). According to the  
260 Kawai et al. (1965) the axis of geomagnetic dipole could have inclined towards Asia at  
261 around the 11<sup>th</sup>-12<sup>th</sup> centuries. In addition, the possibility of auroral occurrence at low  
262 latitudes could demonstrate changes in the location of the North magnetic pole

263 (Silverman, 1998). This study could also be significant constraints for exploration of solar  
264 activity on Earth's atmosphere and climate during the historical periods previously  
265 proved by Bard and Frank (2006). According to the Bard and Frank (2006) solar  
266 fluctuations caused climatic changes called Medieval Warm Period (900–1400). The  
267 Maunder Minimum (1645-1715) which delineates the coldest part of the Little Ice Age  
268 (Eddy, 1976) is depicted by a solar activity reduction, as well as a sunspots scarcity. A  
269 new low sunspot number and lower aurora activity, which occurring in the period  
270 between 2014 and 2025 (Li et al., 2018), might have led to a temporary change in  
271 natural environment influencing the general public's attitudes and socio-economic  
272 factors. Also, resource scarcity and disparities could also lead to social tensions in the  
273 communities for the next ten years.

274         The position of the magnetic poles is the most important factor defining whether  
275 the aurora was observed at a geographic region. Palaeomagnetic data provides similar  
276 longitude values (85° N, 115° E) for the north geomagnetic pole (Merrill and McElhinny,  
277 1983). The positions of the north magnetic pole have changed from 10° to 358° in  
278 longitude and between 79° and 88° in latitude over the past 2500 years (Ohno and  
279 Hamano, 1992). During the interval of 1127–1129, the north geomagnetic pole was  
280 located at a geographic latitude of 80° N, and geographic longitudes including East Asia  
281 (Merrill and McElhinny, 1983; Constable et al., 2000). According to the Fukushima  
282 (1994), the north magnetic pole was located at 81°N in the eastern hemisphere near  
283 East Asia (100°E to 130°E) in the medieval period. The north geomagnetic pole of dipole  
284 axis computed from the average spherical harmonic models were 84.8° N and 103.8° E  
285 in 1100 (Constable et al., 2000).

286 The geomagnetic latitude of Amida (Turkey) in the late 8<sup>th</sup> century to be about  
287 50.1° (Neuhäuser and Neuhäuser, 2015) based on the Holocene geomagnetic field  
288 (Nilsson et al., 2014) and 45° (Hayakawa et al., 2017) based on the location of the North  
289 Geomagnetic Pole over the past 2000 years (Merrill and McElhinny, 1983). According to  
290 the Silverman (2006), the geomagnetic latitude of Edessa and Antioch was 41° and 40°,  
291 respectively. Strong geomagnetic storms, indicating strong solar activity around 770 and  
292 1100 should have been exist in Amida (45°), Edessa (41°) and Antioch (40°).

293 The Medieval Climate Anomaly characterizing by warmer and drier climate  
294 conditions generally related to relatively prolonged solar activity during the 12<sup>th</sup> and 13<sup>th</sup>  
295 centuries (Jirikowic and Damon, 1994). Damon and Jirikowic (1992) estimated that the  
296 rise of global temperature maxima stays below 0.8°C and anomalously high  
297 temperatures pursue during the 12<sup>th</sup> and 13<sup>th</sup> centuries. Sharma (2002) revisited the  
298 issue and proposed that very large solar variations have modulated climate over the  
299 past 200 millennia. Gallet et al. (2006) demonstrated that fluctuations in the  
300 geomagnetic field might trigger significant climate change impacting on some major  
301 societal events in the Middle East at longer time. An inverse relationship amidst the  
302 aurora records, severe winter and famine is estimated during the years of 1100 in  
303 Anatolia. The high aurora activity could be reason of temperature rise during the  
304 medieval period in Anatolia.

305 Haldon et al. (2014) subdivided Medieval into four climatic phases as dry (270-  
306 540), very wet (540-750), moderately dry (750-950) and moderately wet (950-1400)  
307 depending on archaeological, environmental, climate, high resolution pollen and stable  
308 isotope data from sites in central and northwestern Turkey. However, this subdivision  
309 should be revised as dry (0-560), very wet (560-725), moderately dry (725-990) and

310 moderately wet (990-1400) as given in Table 5 by using Anatolian and Middle Eastern  
311 aurora observations besides meteorological data. Affective cold winter, wet climate  
312 conditions, drought and famine could be occurred for Asia Minor and Middle East region  
313 during 990-1400. It seems that the relatively high auroral activity during the years around  
314 1100 both in Anatolia and Middle East indicates that solar activity must have been  
315 intense rather than moderate causing the climate warmer (Fig. 2). In this period, Islamic  
316 world was converted into an enlightened center for science, education, medicine, and  
317 philosophy as previously stated by Hamilton (1982). An important increase in agricultural  
318 production and population seems to have occurred in Anatolia after the year of 1100  
319 where the aurora observations are intense (Fig. 2). Vaquero and Trigo (2012) stated the  
320 period from 1095 to 1204 as an average solar cycle length. Bekli et al. (2017)  
321 demonstrated that the naked-eye sun spot observations from 974 to 1278 and aurora  
322 records from 965 to 1273 show multiple unusual peaks related to the high solar activity  
323 at latitudes below  $45^{\circ}$  by using Chinese and Korean historical sources.

324 In the medieval period, the people were thought that the aurora was a sign of  
325 anger of God, menace, threat, apocalyptic, doomsday, misfortunes, war, slaughter and  
326 bloodshed. Little (2007) described an aurora observation record in Constantinople at 396:  
327 "All people stacked to the church, and the place could not receive huge mass. But after  
328 that great tribulation, when God had accredited His word, the cloud began to diminish  
329 and at last disappeared. The people, freed from fear for a while, again heard that they  
330 must migrate, because the whole city would be destroyed on the next Sabbath. The  
331 whole people left the city with the Emperor; no one remained in his house. The city was

332 saved. What shall we say? adds Augustine. Was this the anger of God or rather His  
333 mercy”?

334 In the Chronicle of Zuqnin, an aurora observation recorded in 772, Amida  
335 (Turkey) was described: “Another sign was seen in the northern side, and its view gave  
336 evidence about the menace of God against us. For the intelligent person the sign  
337 indicated menace. Many people said many things about it; some said it announced  
338 bloodshed, and others said other things. But who knows the deeds of the Lord”?

339 Matthew of Edessa described the aurora phenomenon as a sign of rage,  
340 catastrophe, and celestial wrath of God over the Christians and bloodshed of Christians.  
341 Matthew of Edessa reported: “These predictions were truly realized. No favorable omen  
342 did not appear since the day when the Franks began their expedition. All omens noticed  
343 to realize the destruction, death, slaughter, famine and other diverse disasters”  
344 (Andreasyan, 2000).

345

#### 346 **4. Conclusions**

347 This study establishing the strong solar activity during medieval period reports the  
348 aurora observations recorded both in Anatolia and Middle East region integrating  
349 meteorological data. The following conclusions can be summarized as follows:

350 **1.** Historical Anatolian aurora catalog (hAAc) containing 23 different aurora records provide  
351 important information on variations in geomagnetic and auroral activity during medieval  
352 period.

353 **2.** In Anatolia and Middle East, there was a relatively high auroral activity during the years  
354 around 1100 is quite consistent with the naked-eye sunspot observations.

- 355 3. *The historical Anatolian Aurora catalog exceptionally promote that there is a remarkable*  
356 *correlation between the past solar activity and aurora activity.*
- 357 4. The intensity of dipole moment and position of the geomagnetic pole might be the most  
358 important factors observing aurorae in Anatolia and Middle East regions during medieval  
359 period.
- 360 5. In the Medieval period, Four climatic phases portrayed by Haldon et al. (2014) is revised  
361 as dry (0-560), very wet (560-725), moderately dry (725-990) and moderately wet (990-  
362 1400) depending on aurora observations besides meteorological data.
- 363 6. Further investigations are required to establish a relationship between the solar variability  
364 and climatic changes, such as the Medieval Climate Anomaly or Little Ice Age.
- 365 7. People in medieval Anatolia were believed that the aurora was a sign of celestial wrath of  
366 God, menace, threat, apocalyptic, doomsday, misfortunes, war, slaughter, rage,  
367 catastrophe and bloodshed.

368

## 369 **5. Acknowledgements**

370 We thank Elif KARSLI (KTU), Alam KHAN (GU) and anonymous referees for their  
371 thorough critical and constructive comments. The authors are grateful to Editor for his  
372 advice to improve the quality of this manuscript.
