6

7 **Abstract:** Herein, Anatolian aurora has been reviewed based on the existing
8 catalogs to establish a relationship between the aurora observations and past solar activity
9 during medieval period. For this purpose, historical aurora catalogs for Constantinople
10 and Anatolia are compiled based on the existing catalogs and compared with those in
11 Middle East regions. The available catalogs in literature are covered records observed in
12 the Europe, Japan, China, Russia and Middle East. There is no study dealing only with
13 the historical aurora observations recorded in Anatolia and Constantinople. The data of
14 the catalog support that there is a considerable relationship between the aurora activity
15 and past strong solar activity. High auroral activity around the extreme solar particle storm
16 in 774/775 and the medieval grand maximum in 1100s in Anatolia and Middle East is quite
17 consistent with the past solar variability reported in other scientific literature.

18
19 **Keywords:** Historical aurora record; Solar activity; Anatolia; Constantinople.

23 **1. Introduction**

24 A number of researchers presented the low and middle-latitude aurora catalogs
25 (Table 1) from Europe (Mairan, 1733; Frobesius 1739; Fritz, 1873; Schove, 1948; Link,
26 1962; Dall’Olmo, 1979; Stothers, 1979; Krivsky and Pejml, 1988; Vaquero et al., 2010;
27 Scafetta and Willson, 2013), Arabic countries (Basurah, 2006), Japan (Matsushita, 1956;
28 Nakazawa et al., 2004; Kataoka et al., 2017), and China (Schove and Ho, 1959;
29 Keimatsu,1976; Hayakawa et al., 2015; Kataoka and Iwahashi, 2017). Aurorae are the
30 most majestic luminous phenomenon observed in the sky. The aurora observations were
31 described as “sign”, “a fiery shining sign”, “a very fabulous sign”, “red sky”, “a fiery red
32 sky”, “sky fire”, “a great fire”, “a fiery cloud”, “a frightful and strange omen“, “a fire-like
33 omen”, “a bloody spear light”, “blaze of light”, “a sunlight light”. The form of aurorae was
34 defined as “luminous column”.

35 The historical aurora catalogs have been used to recognize the past solar activities
36 (Siscoe, 1980; Silverman, 1992; Schröder, 1992; Schröder 1994; Basurah, 2006;
37 Vazquez et al., 2006; Hayakawa et al., 2015), Earth’s climate change (Pang and Yau,
38 2002; Schröder, 2004; Gallet et al., 2005; Bard and Frank, 2006; Scafetta, 2012) and
39 perception of human civilizations (Schröder, 2004; Gallet et al., 2006; Silverman, 2006).
40 Korte and Stolze (2016) showed that the intensity and tilt of the geomagnetic field and
41 high solar activity are closely related to the Aurora occurrence. The state of the
42 geomagnetic field and the form of magnetosphere extremely control the location of auroral
43 zone (Korte and Stulze, 2016). The visibility of the aurorae at low latitudes is very scarce
44 and closely connected with the strong geomagnetic storms related to the high-speed solar
45 wind or interplanetary transients (Eather, 1980; Basurah, 2006; Vazquez et al., 2006).

46 Mairan (1733) presented that the first scientific monography covers a list of 229
47 historical aurorae during the period of 502-1731. In 1852, Wolf noticed that the aurorae
48 match with periods of high sunspot number, according to the historical aurora catalog
49 including more than 6300 records (Wolf, 1857). Fritz (1873), who listed 77 European
50 Aurora records during 1707-1708, published the historical auroral catalog and separated
51 auroral sightings into five categories based on the latitude and longitude (Schröder, 1994).
52 Link (1962) published a useful aurora catalog seen in European countries based on eight
53 previous catalogs compiled by Frobeseius (1739), Mairan (1754), Schoning (1760), Boué
54 (1856), Wolf (1857), Lovering (1868), Fritz (1873) and Seydl (1954).

55 Vaquero et al. (2010) declared a set of auroral observation of Francisco Salva
56 Campillo who recorded in Barcelona during 1780-1825. This catalog represents a sudden
57 drop in the number of annual auroral observations at about 1793 owing to the secular
58 minimum in solar activity (Vaquero et al., 2010). Scafetta and Willson (2013) studied the
59 historical Hungarian auroral records covering 438 years. They found that the maxima of
60 the auroral observations comply with the maxima in the sunspot records and there is a
61 positive correlation between the auroral records and the solar activities.

62 Neuhäuser and Neuhäuser (2015) are implemented five criteria of likeliness for
63 aurora catalogs as night-time (darkness, sunset, sunrise), non-southern directions
64 (northern, NE, NW, E-W, W-E), color (red, reddish, fiery, bloody, green, black), dynamics
65 (fire, fiery), and repetition. However, these criteria directly contradicted auroral behaviour
66 during the extreme space weather events, as overhead aurora can extend down to $\sim 25^\circ$
67 in magnetic latitude (vs $40\text{--}50^\circ$ in Anatolia) and the whitish aurora appears more
68 equatorial side (Kimball, 1960; Kataoka and Iwahashi, 2017; Kataoka et al., 2019;
69 Kataoka and Kazama, 2019). Indeed, Stephenson et al. (2019) rejected these criteria and

70 their analyses on the basis of multiple counter-examples during the extreme space
71 weather events and confirmed an enhanced solar activity around this epoch. Recently,
72 such candidate records of mid-latitude aurorae have been intensively investigated (e.g.,
73 Usoskin et al., 2013; Stephenson, 2015), due to the discovery of footprints of an extreme
74 solar particle storm in the cosmogenic isotopes around 774/775 (Miyake et al., 2012;
75 Usoskin et al., 2013; Mekhaldi et al., 2015). Their conclusion is consistent with the isotope
76 evidence for the extreme solar particle storm such as the detected ratio of Be^{10} and Cl^{36}
77 (Mekhaldi et al., 2015), latitudinal concentration of C^{14} concentration (Uusitalo et al.,
78 2018), and coincidental spikes of the multiple cosmogenic isotopes in both hemispheres
79 (Büntgen et al., 2018).

80 The goal of this study is to compile a historical aurora catalog based on the existing
81 catalogs, in order to analyse the past solar activity during the medieval period. This
82 research may also contribute to the understanding of public perception of the historical
83 auroras. Constantinople and Anatolia have only been peripherally discussed up to now
84 with regard to auroral observations.

85

86 **2. Historical Aurora Borealis catalog for Anatolia and Constantinople**
87 **(hABcAC) in the medieval period**

88 It is propounded a historical aurora catalog observed only in Anatolia and
89 Constantinople during medieval period collected from Link (1962), Botley (1964), Baldwin
90 (1969), Newton (1972), Stothers (1979), Eather (1980), Melissinos, (1980), Silverman
91 (1998), Dall’Olmo (1979), Andreatyan (2000), Little (2007), Silverman (2006), Neuhäuser
92 and Neuhäuser (2015) resources. In this catalogue, 21 different historical aurora
93 observations recorded in Anatolia and Constantinople during medieval period are

94 presented in Table 2. The location map of the historical aurora observations is given in
95 Figure 1 and summarized in Table 3. Another collected ancient aurora catalog consisting
96 40 auroral observations is shown in Table 4 for the Middle East region during the same
97 period using Islamic historical texts, Arabic chronicles and other auroral records given in
98 Table 1. These two catalogues are plotted in Figure 2 and evaluated altogether. The
99 Middle East aurora records and hABcAC overlap through medieval period especially
100 between 1097 and 1129 years (Fig. 3). Also, Chinese and European aurora observations
101 are in harmony with each other in this period (Siscoe, 1980).

102 In this catalog, the first auroral observation was observed in Constantinople at 333.
103 Stothers (1979) described these observations as a sky fire according to the works of
104 Aurelius Victor (320-390), who was a historian and politician of the Roman Empire. On
105 the other hand, Eather (1980) described an Aurora observation over Constantinople at
106 about 360 BC during the siege on Byzantium by Philip of Macedonia.

107 Little (2007) described an aurora observation record in Constantinople at 396: “A
108 fiery cloud was observed from the East while the city darkened. At first, it was small, but
109 later gradually grew and moved towards the city. At last, it terribly enlarged and poised
110 over the entire city. A terrifying flame appeared to hang down. All people stacked to the
111 church, and the place could not receive huge mass”.

112 According to the Link (1962) and Hayakawa et al., 2017, an aurora appeared in
113 Asia Minor on 22 August 502, Thursday. This aurora was also observed both in Edessa
114 (Botley, 1964) and Palestine after an earthquake (Russell, 1985) based on to the
115 Chronicle of Joshua the Stylite and Chronicle of Zuqin. Joshua the Stylite described it:
116 “On the 22rd of August this year, on the night preceding Friday, a great fire appeared to
117 us blazing in the northern quarter the all night. It was believed that the whole earth was

118 going to be devastated that night by a fire storm. However, the mercy of our Lord
119 preserved us without damage”. This appearance of the aurora borealis was also reported
120 in *Chronicon Edessenum* without apocalyptic detail (Trombley and Watt, 2000).

121 According to the *Historia Ecclesiastica* of Ptolomaeus Lucensis there was an
122 aurora sighting at a night of 633 in Constantinople (Dall’Olmo, 1979): “A bloody sign
123 appearing just at that time was sighted. A bloodstained spear and a sharp light were
124 observed on the sky for nearly all night”. Theophanes (758/760-817), a Byzantine monk,
125 theologian, and chronicler, reported an observation in 667 winter: “There was a sign which
126 appeared in the sky in the same winter”. Theophanes reported another observation in
127 675-676: “This year a sign was seen in the sky on a Sabbath day” (Turtledove, 1982).

128 Theophanes recorded three aurora events for 734, 743 June and 744 in
129 Constantinople. The first aurora observation was reported in 734: “A fiery sign shining like
130 a burning brand appeared in the sky in Constantinople”. The second aurora observation
131 was recorded by Theophanes in June of 743: “In the northern sky of Constantinople, a
132 sign was observed in the month of June” (Turtledove, 1982). The last aurora record was
133 observed in Constantinople for 744: “In the northern sky, a sign seemed this year, and
134 dust fell in several places” (Turtledove, 1982; Neuhäuser and Neuhäuser, 2015).

135 Harrak (1999) and Hayakawa et al. (2017) listed two aurorae records observed
136 near Amida in the early 770s based on the *Chronicle of Zuqnin*. In the *Chronicle of Zuqnin*,
137 the first observation was recorded in 771/772, Amida: “Another sign was seen in the
138 northern side, and its view gave evidence about the menace of God against us. It
139 appeared at reaping time, while wrapping the whole northern side of the sky from west to
140 east end. It was look like a green sceptre, a red one, a yellow one, and a black one. It was
141 ascending from the ground and changing into 70 shapes, while one sceptre was emerging

142 and another disappearing”. The second observation was recorded in the Chronicle of
143 Zuqnin in 773, Amida: “In the month of June, on a Friday, another sign that was seen a
144 year ago in the northern region was appeared again this year. It was on Fridays that it
145 used to appear during these three consecutive years, stretching itself out from the eastern
146 side to the western side. The sign would change into many shapes in such a way that as
147 soon as a green ray vanished, a red one would appear, and as soon as the yellow one
148 vanished, a green would appear, and as soon as this one vanished, a black one would
149 appear” (Harrak, 1999). These two observations listed by Harrak (1999) based on the
150 Chronicle of Zuqnin were also cited by Dall’Olmo (1979) according to the Chronique de
151 Denys de Tell-Mahré (Chabot, 1895) with different dating. In Constantinople, another
152 aurora observation was recorded in 988: “A luminous star and fiery pillars seen in the
153 northern region of the sky for some nights. They frightened the people who saw them.”
154 (Dall’Olmo, 1979).

155 Matthew of Edessa, who wrote a chronicle, described the events that occurred
156 between the years 952 and 1136, and reported four aurora observations around the year
157 1100 (Andreasyan, 2000). Matthew of Edessa reported the first aurora observation in the
158 Armenian year 546 (25.02.1097–24.02.1098): “In this year, an odd and horrible signs were
159 observed in the the northern side of the sky. No one had ever seen such an amazing
160 omen so far. In the month of November, the sky kindled and reddened though the air was
161 clear and quiet. The bloody sky was covered with stacks as if clustered on top of one
162 another becoming colorful. The stacks were set to slip through in an easterly direction,
163 dispersed after having gathered, and enveloped the large amount of the sky. Then, the
164 dark redness such an amazing degree reached up to the middle of the sky vault. The
165 savants and sages interpreted this phenomenon that, it was a sign of bloodshed. Actually,

166 terrible events and disasters we included as a short story in our book were soon to be
167 fulfilled.”

168 Krey (1921) described an aurora observation during the siege of Antioch on the
169 account of eyewitnesses and participants in the first crusade: “A great earthquake
170 occurred on the third day before the Kalends of January (30 December 1097), and a very
171 fabulous sign was noticed in the sky. Northern part of the sky was so red that it appeared
172 as if sun rose to inform the day in the first sight of the night”. This observation was also
173 described by Baldwin (1969): “There was an earthquake on December 30th, and a
174 frightening display of the aurora borealis next evening, and in this way God chastised his
175 army, so that we were intent upon the light which was rising in the darkness, yet the minds
176 of some were so blind and abandoned that they were recalled neither from luxury nor
177 robbery. At this time the Bishop prescribed a fast of three days and urged prayers and
178 alms, together with a procession, upon the people; moreover, he commanded the priests
179 to devote themselves to masses and prayers, the clerics to psalms”. On the other hand,
180 another aurora was observed on 3 June 1098 at Antioch based on the Link (1962) catalog
181 as a fiery red sky (Silverman, 2006).

182 The Matthew of Edessa recorded second aurora observation in the Armenian year
183 547 (25.02.1098–24.02.1099). “In the same year, a new sign appeared in the northern
184 part of the sky. At the fourth hour of the night, the sky appeared more inflamed than before,
185 and a dark red color. This phenomenon lasted from the evening until the fourth hour of
186 the night. Such a terrible omen had never been seen so far. This omen raised upwards
187 gradually and covered the northern portion of the sky with the lines reaching the hills. All
188 stars took a fiery color. This phenomenon was an omen of rage and catastrophe”

189 (Andreasian, 2000). Botley (1964) reported an auroral observation in Antioch as a blaze
190 of light girdled Pole. Link (1962) dated this observation on September 27, 1098.

191 In the Armenian year 548 (25.02.1099–24.02.1100) Matthew reported another
192 aurora observation: “A fiery sign of dark red color appeared in the sky in this year. This
193 omen heading from the northern to the eastern part of the sky appeared until the seventh
194 hour of the night and then became black. It was said that this phenomenon was a sign of
195 bloodshed of Christians. These predictions were truly realized. No favorable omen did not
196 appear since the day when the Franks began their expedition. All omens, however,
197 marked to realize the destruction, death, slaughter, famine and other diverse disasters”
198 (Andreasian, 2000).

199 Matthew recorded the last aurora observation in the Armenian year 549
200 (25.02.1100–24.02.1101): “The northern part of the sky flushed red for the fourth time in
201 this year. The fiery red omen appeared more horrific than the previous one and
202 subsequently changed into black. This fourth appearance coincided with a lunar eclipse.
203 This phenomenon was a sign of the celestial wrath of God over the Christians as
204 previously said by the prophet Jeremiah with these words: “His wrath will blaze up from
205 the northern part of the sky. Indeed, several misfortunes occurred as we never could have
206 expected” (Andreasian, 2000).

207 Dall'Olmo (1979) reported an aurora observation based on the Chronicle of Michael
208 the Syrian translated into French by Chabot (1968): “In the year 1108, a light like the
209 sunlight was seen in the middle of the night, and remained about three hours in Djihan
210 region near Adana”. Dall'Olmo (1979) was also cited 12 auroral records observed
211 probably in the Middle East from 745 to 1141 (Table 4) according to the Chronicle of
212 Michael the Syrian (Chabot, 1968).

213 Priest Grigor, who continued the Matthew's Chronicle and recorded events for the
214 years 1136/37-1162/63, added one aurora observation in about the year 1143. In the
215 Armenian year 592 (14.02.1143-13.02.1144) Priest Grigor described the aurora
216 observation: "On Holy Thursday (1 April 1143), an omen forming of a luminous column
217 appeared in the northern portion of the sky. This omen was visible for eight days. Three
218 sovereigns died after the appearance of this phenomenon" (Andreasyan, 2000).

219

220 **3. Results and Discussions**

221 The main purpose of this study is to present an aurora catalog for the
222 Constantinople and Anatolia during the medieval period based on the existing catalogs.
223 Twenty-three different historical aurora records are presented in Constantinople and
224 Anatolia during the medieval period (Table 2). Another aurora catalog containing 40
225 records collected from different sources is also given (Le Strange, 1890; Link, 1962;
226 Botley, 1964; Newton, 1972; Dall'Olmo, 1979; Silverman, 1998; Basurah, 2006) for the
227 Middle East region (Table 4). The aurorae were generally seen in the northern and eastern
228 part of the sky. The color of the aurora observations was red, green, yellow and black
229 depending on the height and relative concentrations of the nitrogen and oxygen
230 compounds in the atmosphere (Eather, 1980).

231 The aurora records strongly correlated to high solar activity (Siscoe, 1980) provide
232 some information about the Sun-Earth interaction as previously proved by Scafetta
233 (2012). Stronger solar dynamics were realized in aurorae with color green-yellow-red as
234 seen in 772 and 773 in Amida. The low-latitude aurorae of 772-773 are interesting, as
235 being very close to the extreme solar event of 774/775 (Miyake et al., 2012; Usoskin et
236 al., 2013; Mekhaldi et al., 2015). Miyake et al. (2012) and Usoskin et al. (2013) confirmed

237 the 770s high solar events presenting ^{14}C measurements from the annual rings of the
238 cedar trees in Japan and inappropriate carbon cycle model in German oak, respectively.
239 These low-latitude aurorae are quite close from the extreme solar particle storm in
240 774/775 and support not the solar minimum (Neuhäuser and Neuhäuser, 2015) but high
241 solar activity (Usoskin et al., 2013; Mekhaldi et al., 2015; Stephenson et al., 2019). The
242 auroral records have also proven itself to be a valuable data source for the investigation
243 of the secular variation of solar activity.

244 Paleomagnetic researchs demonstrate that the recent dipole strength was nearly
245 50% weaker than it was 2500 years ago (Raspopov et al., 2003). Siscoe and Siebert
246 (2002) indicated that the dipole strength was 1.5 times as large as that of the present
247 value. The position of the geomagnetic latitude and dipole moment might be the reason
248 of observing aurorae in Constantinople and Anatolia so frequently. The average dipole
249 moment for 750 and 1250 are $8.85 \cdot 10^{22} \text{ Am}^2$ and $8.90 \cdot 10^{22} \text{ Am}^2$ slightly higher than the
250 present value of $7.78 \cdot 10^{22} \text{ Am}^2$ (Korte and Constable, 2005; Gallet et al., 2005). According
251 to the Kawai et al. (1965) the axis of geomagnetic dipole could have inclined towards Asia
252 at around the 11th-12th centuries. In addition, the possibility of auroral occurrence at low
253 latitudes could demonstrate changes in the location of the North magnetic pole
254 (Silverman, 1998).

255 The position of the magnetic poles is the most important factor defining whether
256 the aurora was observed at a geographic region. Palaeomagnetic data provides similar
257 longitude values (85° N , 115° E) for the north geomagnetic pole (Merrill and McElhinny,
258 1983). The positions of the north magnetic pole have changed from 10° N to 358° N in
259 longitude and between 79° E and 88° E in latitude over the past 2500 years (Ohno and

260 Hamano, 1992). During the interval of 1127–1129, the north geomagnetic pole was
261 located at a geographic latitude of 80° N, and geographic longitudes including East Asia
262 (Merrill and McElhinny, 1983; Constable et al., 2000). According to the Fukushima (1994),
263 the north magnetic pole was located at 81°N in the eastern hemisphere near East Asia
264 (100°E to 130°E) in the medieval period. The north geomagnetic pole of dipole axis
265 computed from the average spherical harmonic models were 84.8° N and 103.8° E in
266 1100 (Constable et al., 2000).

267 The geomagnetic latitude of Amida in the late 8th century to be about 50.1° N
268 (Neuhäuser and Neuhäuser, 2015) based on the Holocene geomagnetic field (Nilsson et
269 al., 2014) and 45° N (Hayakawa et al., 2017) based on the location of the North
270 Geomagnetic Pole over the past 2000 years (Merrill and McElhinny, 1983). According to
271 the Silverman (2006), the geomagnetic latitude of Edessa and Antioch was 41° N and 40°
272 N, respectively. Strong geomagnetic storms, indicating strong solar activity around 770
273 and 1100 should have been exist in Amida (45° N), Edessa (41° N) and Antioch (40°).

274 Bekli et al. (2017) demonstrated that the naked eye sunspot observations from 974
275 to 1278 and aurora records from 965 to 1273 show multiple unusual peaks related to the
276 high solar activity at latitudes below 45° N by using Chinese and Korean historical
277 sources. The high aurora activity events associated with great magnetic storms occurred
278 around the maximum phase of solar cycles rather than around the minimum (Kataoka et
279 al., 2017). Vaquero and Trigo (2012) stated the period from 1095 to 1204 as an average
280 solar cycle length, whereas this needs to be carefully compared with the reconstructed
281 solar cycles on the basis of cosmogenic isotopes (Miyahara et al., 2008; Kataoka et al.,
282 2017). Nevertheless, this period is characterised with numerous records of sunspots and

283 aurorae shown in Vaquero and Vazquez (2009) and supported by Anatolian reports
284 compiled in this article. This is highly consistent with an appearance of a gigantic sunspot
285 in 1128 that caused a serious geomagnetic storm (Willis and Stephenson, 2001).

286 In the medieval period, the people thought that the aurora was a sign of anger of
287 God, menace, threat, apocalyptic, doomsday, misfortunes, war, slaughter and bloodshed.
288 Little (2007) described an aurora observation record in Constantinople at 396: “All people
289 stacked to the church, and the place could not receive huge mass. But after that great
290 tribulation, when God had accredited His word, the cloud began to diminish and at last
291 disappeared. The people, freed from fear for a while, again heard that they must migrate,
292 because the whole city would be destroyed on the next Sabbath. The whole people left
293 the city with the Emperor; no one remained in his house. The city was saved. What shall
294 we say? adds Augustine. Was this the anger of God or rather His mercy”?

295 In the Chronicle of Zuqin, an aurora observation recorded in 772, Amida was
296 described: “Another sign was seen in the northern side, and its view gave evidence about
297 the menace of God against us. For the intelligent person the sign indicated menace. Many
298 people said many things about it; some said it announced bloodshed, and others said
299 other things. But who knows the deeds of the Lord”?

300 Matthew of Edessa described the aurora phenomenon as a sign of rage,
301 catastrophe, and celestial wrath of God over the Christians and bloodshed of Christians.
302 Matthew of Edessa reported: “These predictions were truly realized. No favorable omen
303 did not appear since the day when the Franks began their expedition. All omens noticed
304 to realize the destruction, death, slaughter, famine and other diverse disasters”
305 (Andreasyan, 2000).

306

307 **4. Conclusions**

308 This study establishing the solar activity during medieval period reports the aurora
309 observations recorded in Constantinople, Anatolia and Middle East regions. The following
310 conclusions can be summarized as follows:

- 311 1. Historical Aurora catalog for Constantinople and Anatolia (hABcAC) containing 21
312 different aurora records provide important information on variations in the
313 geomagnetic field and auroral activity during medieval period.
- 314 2. The solar activity, intensity of dipole moment and position of the geomagnetic pole
315 might be the most important factors observing aurorae in Constantinople, Anatolia
316 and Middle East regions.
- 317 3. The historical Aurora catalogs exceptionally promote that there is a remarkable
318 correlation between the past solar activity and aurora.
- 319 4. In Constantinople, Anatolia and Middle East, there was a relatively high auroral
320 activity during the years around 1100 is quite consistent with the naked-eye
321 sunspot observations related to solar activity as stated by Vaquero et al. (1997) and
322 Bekli et al. (2017).
- 323 5. People were believed that the aurora was a sign of celestial wrath of God, menace,
324 threat, apocalyptic, doomsday, misfortunes, war, slaughter, rage, catastrophe and
325 bloodshed.
- 326 6. The high and low auroral events associated with solar activity variations provide
327 substantial use of knowledge to design and alleviate the space weather hazards in
328 future.

Table 4 continued.

23	1129 April	Middle East	A fire appeared in the northern region. A sort of pillar was stretched toward the south.	Dall'Olmo, 1979
24	1130 November	Middle East	A burning fire was seen in the northern region	Dall'Olmo, 1979
25	1135 July 21	Middle East	A light like a torch moved from east to West. The light of the moon and of the stars was obscured. A frightful noise followed	Dall'Olmo, 1979
26	1138 October	Syria	A red sign was seen in the northern part of the sky	Botley, 1964
27	1140 June 22	Syria	Red lances were seen in the northern region.	Botley, 1964
28	1141 August	Middle East	Rays of fire were observed in the northern region.	Dall'Olmo, 1979
29	1141 September	Syria	A brightness as bright as the sun broke out in the northeast. It shone as if the sky were on fire.	Botley, 1964
30	1149	Syria		Botley, 1964
31	1150	Palestine		Botley, 1964
32	1176 September 6 - October 5	Syria	An intense red light appeared in the sky from the East	Basurah, 2006
33				
34	1179 May 7	Syria	The sky became cloudy and pillars of fire appeared at the horizon	Basurah, 2006
35	1187 July	Tiberias, Israel		Botley, 1964
36	1223 October 26	Syria	We saw from Bani Helal Mountain (toward the North direction) a hugelight over Gassune; we thought that Damascus was on fire. Bright glowing columns appeared toward North-West	Basurah, 2006
37	1264 July 20-30	Syria		Basurah, 2006
	1370 November 27	Jerusalem	A great reddish glow appeared in the sky of Jerusalem	Basurah, 2006
38	1370 November 27	Damascus	A great reddish glow appeared in the sky of Damascus	Basurah, 2006
39	1370 November 27	Homs	A great reddish glow appeared in the sky of Homs	Basurah, 2006
40	1370 November 27	Aleppo	A great reddish glow appeared in the sky of Aleppo	Basurah, 2006
